51 Problems in Calculating Limits Using L'Hôpital's Rule with Solutions (Part 8)

50. Let $y = \left(1 + \frac{x}{n}\right)^n$.

$$\text{Hence, } \ln(y) = \ln\left[\left(1 + \frac{x}{n}\right)^n\right] = n \ln\left(1 + \frac{x}{n}\right) = \frac{\ln\left(1 + \frac{x}{n}\right)}{\frac{1}{n}}.$$

$$\begin{aligned} \text{So, } \lim_{n \rightarrow \infty} \ln(y) &= \lim_{n \rightarrow \infty} \frac{\ln\left(1 + \frac{x}{n}\right)}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{\ln\left(\frac{n+x}{n}\right)}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{\ln(n+x) - \ln(n)}{n^{-1}} \stackrel{LH}{=} \lim_{n \rightarrow \infty} \frac{\left(\frac{1}{n+x} - \frac{1}{n}\right)}{-n^{-2}} = \lim_{n \rightarrow \infty} \frac{\left(\frac{n-n-x}{n(n+x)}\right)}{\left(\frac{-1}{n^2}\right)} = \\ &= \lim_{n \rightarrow \infty} \frac{-x}{n(n+x)} \cdot \frac{n^2}{-1} = \lim_{n \rightarrow \infty} \frac{nx}{n+x} = \lim_{n \rightarrow \infty} \frac{nx}{n\left(1 + \frac{x}{n}\right)} = \lim_{n \rightarrow \infty} \frac{x}{1 + \frac{x}{n}} = \frac{x}{1+0} = x. \end{aligned}$$

That is, $\lim_{n \rightarrow \infty} \ln(y) = x$.

Now $y = y \Leftrightarrow \ln(y) = \ln(y) \Leftrightarrow e^{\ln(y)} = y$. Therefore, $\lim_{n \rightarrow \infty} \left(1 + \frac{x}{n}\right)^n = \lim_{n \rightarrow \infty} y =$

$$= \lim_{n \rightarrow \infty} e^{\ln(y)} = e^{\lim_{n \rightarrow \infty} \ln(y)} = e^x.$$

51. Let $y = \left(1 + \frac{r}{n}\right)^{nt}$.

$$\begin{aligned} \text{Hence, } \ln(y) &= \ln\left[\left(1 + \frac{r}{n}\right)^{nt}\right] = nt \ln\left(1 + \frac{r}{n}\right) = \frac{t \ln\left(1 + \frac{r}{n}\right)}{\frac{1}{n}} = \frac{t \ln\left(\frac{n+r}{n}\right)}{\frac{1}{n}} \\ &= \frac{t \ln(n+r) - t \ln(n)}{\frac{1}{n}}. \end{aligned}$$

$$\begin{aligned} \text{So, } \lim_{n \rightarrow \infty} \ln(y) &= \lim_{n \rightarrow \infty} \frac{t \ln(n+r) - t \ln(n)}{\frac{1}{n}} = \lim_{n \rightarrow \infty} \frac{t \ln(n+r) - t \ln(n)}{n^{-1}} \stackrel{LH}{\sim} \lim_{n \rightarrow \infty} \frac{\frac{t}{n+r} - \frac{t}{n}}{-n^{-2}} = \lim_{n \rightarrow \infty} \frac{\frac{t}{n+r} - \frac{t}{n}}{\frac{-1}{n^2}} \\ &= \lim_{n \rightarrow \infty} \left(\frac{-tn^2}{n+r} + \frac{tn^2}{n} \right) = \lim_{n \rightarrow \infty} \frac{-tn^3 + tn^3 + rtn^2}{n(n+r)} = \lim_{n \rightarrow \infty} \frac{rtn}{n+r} = \lim_{n \rightarrow \infty} \frac{rtn}{n\left(1 + \frac{r}{n}\right)} \\ &= \lim_{n \rightarrow \infty} \frac{rt}{1 + \frac{r}{n}} = \frac{rt}{1+0} = rt. \end{aligned}$$

That is, $\lim_{n \rightarrow \infty} \ln(y) = rt$.

$$\begin{aligned} \text{Now } y = y &\Leftrightarrow \ln(y) = \ln(y) \Leftrightarrow e^{\ln(y)} = y. \text{ Therefore, } \lim_{n \rightarrow \infty} \left(1 + \frac{r}{n}\right)^{nt} = \lim_{n \rightarrow \infty} y = \\ &= \lim_{n \rightarrow \infty} e^{\ln(y)} = e^{\lim_{n \rightarrow \infty} \ln(y)} = e^{rt}. \end{aligned}$$
