An Essential Skill for Calculus Students: Trigonometry (Part 2)

3. Needed identities. For sure a calculus student must have memorized the following trigonometric identities:

 $\tan(\theta) = \frac{\sin(\theta)}{\cos(\theta)} \qquad \sec(\theta) = \frac{1}{\cos(\theta)} \qquad \csc(\theta) = \frac{1}{\sin(\theta)} \qquad \cot(\theta) = \frac{1}{\tan(\theta)}$

Furthermore, the Pythagorean identity must be automatized:

$$\sin^2(\theta) + \cos^2(\theta) = 1$$

There are two variations of the Pythagorean identity that are especially important in integral calculus. They can easily be derived on the fly as follows.

 $\sin^{2}(\theta) + \cos^{2}(\theta) = 1$ State the Pythagorean identity. $\frac{\sin^{2}(\theta)}{\cos^{2}(\theta)} + \frac{\cos^{2}(\theta)}{\cos^{2}(\theta)} = \frac{1}{\cos^{2}(\theta)}$ Divide both sides by $\cos^{2}(\theta)$. $\boxed{\tan^{2}(\theta) + 1 = \sec^{2}(\theta)}$ Simplify.

The second variation follows by a similar line of reasoning.

$\sin^2(\theta) + \cos^2(\theta) = 1$	State the Pythagorean identity.
$\frac{\sin^{2}(\theta)}{\sin^{2}(\theta)} + \frac{\cos^{2}(\theta)}{\sin^{2}(\theta)} = \frac{1}{\sin^{2}(\theta)}$	Divide both sides by $\sin^2(\theta)$.
$1 + \cot^2(\theta) = \csc^2(\theta)$	Simplify.

4. Radian measure. When thinking of trigonometric functions as applied to circles, calculus uses only radian measure.

Consider a circle with central angle θ with a radius of four inches.

If the arc length of \widehat{AB} also equals four inches,

then θ is said to have a radian measure of one. If instead the arc length of \widehat{AB} equals eight while the radius remains at four,

then θ is said to have a radian measure of two. In other words, the radian measure begins by marking off arc lengths equal to the radius of the circle.
